

note github

for login any user Django use his premade features, and for change that, it would have to be done before in the project, before the first migration, like i didn't know that the **useer** table was created for the users be able to log in but that can't be done now whit out damaged to the project, so for the users be able to log in and restrict who can see what pages it is necessary to se the default table of Django "**user**" and use the table created for the project "**useer**" like a profile for the table **user** and make the necessary changes to the project and try this could damage the project so here is a to do list of what is going to be done:

- ☐ see and list the fields in the **user** table
- ☐ see what parts of the project the change will affect
- ☐ make a to do list for the pages that will result affected
- ☐ delete the fields that repeat in **usser**
- ☐ follow the tutorials for: create-singup-login-logout in a test page
- ☐ add the **useer** form before the submit button in the sing in test
- ☐ verify the info from user in a test page it has to show all the fields on **user** and **useer**
- ☐ cliient and admin now has to have a One to one relation whit **user**
- ☐ make the rest of the job like substitute the info for display and the formats
- ☐ fullfil the to do list for the affected pages
- ☐ do permesions
